Yes

Education/Pearls

Behavioral patients provide a unique challenge in danger to the healthcare provider, as well as often losing their decision-making capacity. Patients with mental health disorders often have co-existing medical conditions.

Combative patients with traumatic injury/TBI present a uniquely challenging scenario. The provider must consider the risks of causing hypotension by providing chemical sedation only when absolutely necessary.

- Security is essential:
 - Always be sure to protect yourself and others.
 - Patients who verbalize a danger to self or others may NOT refuse care.
 - Attempt to protect patient from injury, but do not place yourself in danger to do so.
 - Summon law enforcement as necessary.

- Restraints should only be used if necessary:
 - Physical Restraint:
 - Handcuffs are to be placed by law enforcement only. If in law enforcement handcuffs, key must be within proximity of patient care at all times (but not within patient's reach).
 - Place stretcher in sitting position.
 - Do not apply restraints that restrict the patient's chest wall movement.
 - Pearls for extremity restraint:
 - Soft or leather restraints should not require a key
 - Restrain all four extremities to stationary frame of stretcher
 - All restraints must allow quick release
 - Reassess and document neurovascular status of all extremities every 15 minutes
 - Chemical Restraint:
 - Utilize with caution, as all restraint medications can cause respiratory compromise
 - Should be a later consideration for pediatric patients
 - EtCO₂ should be utilized for all patients who receive restraints.

- Apply cardiac monitor and obtain vital signs as soon as possible, particularly when chemical restraints have been administered. Reassess VS every 5 minutes and document patient status, response, and monitor airway.
